1. INTRODUCTION

This additional technical memo addresses project updates in response to comments on the Draft Environmental Impact Report (DEIR)\(^1\) for the San Diego State University Mission Valley Campus Master Plan. This report includes the quantification of five Project Design Feature (PDF) updates as follows:

1) No natural gas or wood-burning fireplaces in residential units;
2) Additional solar photovoltaic (PV) panel installation;
3) Electric heating, cooling, and ventilation systems (HVAC) and electric water heating systems;
4) Naturally ventilated parking structures; and
5) EV chargers will be built in accordance with the 2019 Title 24 Building Standards.

The methodological parameters and inputs used when quantifying these project design features follow those as included in the Air Quality, Greenhouse Gas (GHG), and Energy Technical Reports for the San Diego State University (SDSU) Mission Valley Campus Master Plan Project, prepared by Ramboll.

1.1 Project Description

This analysis is of the San Diego State University Mission Valley Campus Master Plan as included and described in the Final Environmental Impact Report (FEIR). Analysis of the proposed project's emissions inventories considers and incorporates several PDFs as described in the following section.

Project Design Features

As discussed in the DEIR, the project includes a number of sustainability-oriented PDFs that are intended to move the project "beyond code.” Many of these PDFs are consistent with the City of San Diego Climate Action Plan (CAP) and its implementing CAP Consistency Checklist, as well as the City’s Mission Valley Community Plan Update (MVCPU). Additions and deletions made to the PDF language in the FEIR as compared to the DEIR are shown in underline and strikeout format.

A subset of the PDFs has been quantitatively included in this analysis, while the remaining PDFs have not been quantified (due to modelling or other calculation-related limitations). PDFs that have been quantified in this report are:

TDM Program

The project’s Transportation Demand Management (TDM) Program incentivizes alternative transportation besides single commuter trips. The TDM Program consists of the following:

- Land Use Diversity

---

• Neighborhood Site Enhancement
  – New Bicycle Facilities
  – Dedicated Land for Bicycle/Multi-Use Trails
  – Bicycle Parking
  – Showers and Lockers in Employment Areas
  – Increased Intersection Density
  – Traffic Calming
  – Car Share Service Accommodations
  – Enhanced Pedestrian Network

• Parking Policy and Pricing
  – Unbundled Residential Parking
  – Metered On-Street Parking
  – Reduced Parking Supply

• Commute Trip Reduction Services
  – TDM Program Coordinator and Marketing
  – Electric Bike-Share Accommodations
  – Ridesharing Support
  – School Pool
  – Hotel Shuttle Service

The TDM Program strategies described above apply to the project’s campus office, residential and retail uses.

TDM Program strategies also have been developed exclusively for the project’s stadium land use that are not listed here, as they are not quantitatively accounted for in this analysis (see below). For additional information on the project’s TDM Program, with respect to both stadium and non-stadium uses, please see Fehr & Peers’ Transportation Impact Analysis (2019) for the project.

Residential Hearths

The proposed project is incorporating a limited number of natural gas fireplaces, and no wood-burning fireplaces, within project residences. Of all residential units in the project, up to 5% of the units may include a natural gas fireplace. Residential units in the proposed project shall not have natural gas fireplaces or wood-burning fireplaces.

Solar Photovoltaic (PV) Panels

The proposed project is incorporating solar PV panels on a total of approximately 428,458 square feet of available roof space that is located throughout the project’s campus/office, hotel, stadium and residential development areas; these panels are estimated to create a total generation capacity equivalent to 10,895,660 kilowatt-hour of electricity, or
15.0% - 14.9% of the proposed project’s total project electricity demand. In the event that the final stadium design does not accommodate the approximately 3,000 square feet of solar PV coverage called for in this PDF, the PV panels shall be installed in other on-site development areas.

**Building Heating and Cooling**

As part of the Mechanical, Electrical and Plumbing Plans (MEPs) for all non-stadium buildings, CSU/SDSU shall require all heating, cooling and ventilation systems (HVAC) and water heating systems to be electric.

**Naturally Ventilated Parking Structures**

All structured parking on the project site shall be naturally ventilated.

**Electric Vehicle (EV)-Ready Infrastructure and EV Chargers**

The project is equipping 3% - 10% of total residential parking spaces and 6% of total non-residential parking spaces with appropriate electric supply equipment to allow for the future installation of EV chargers (i.e., “EV ready”). Of these EV ready spaces, 50% will be equipped with EV charging stations. In total, approximately 500 - 901 spaces will be designated as “EV ready” and 252 - 451 of the “EV ready” spaces will be equipped with operable EV charging stations.

Additional PDFs that have not been quantified in this report include:

- The layout of the project’s development areas has been designed to maximize the unique infill opportunity presented at this Mission Valley location. This includes benefits from the existing Metropolitan Transit System’s Green Line transit station that runs through the project, as well as the planned Purple Line transit station.

- The development locates buildings in close proximity to one another, which would facilitate the use of common heating/cooling sources, where feasible, as project-level development proceeds. (The use of common heating/cooling sources will be evaluated as the building plans for individual development parcels are developed; relevant factors that will influence the use of such sources include the temporal proximity of development, type of use, and market forces.)

- Project development areas would maximize natural ventilation.

- The proposed project would include adaptive lighting controls, where appropriate and feasible, in order to maximize energy efficiency and minimize light pollution.

- The proposed project would achieve Leadership in Energy and Environmental Design (LEED) Version 4 at a Silver or better certification level, as well as a Neighborhood Development designation for sitewide design. LEED certification is based on standards that encourage the development of energy-efficient and sustainable buildings.

- Events at the proposed project’s multipurpose stadium would benefit from the implementation of TDM Program strategies specifically developed for application to stadium-related events. These strategies focus on the use of alternative modes of transportation, including transit, to reduce single-occupancy vehicle usage and parking demand on event days.
• As part of the scoring system for evaluating responses to Requests for Proposals and through the builder/developer review and selection process for each future building site within the Mission Valley Campus Master Plan Area, CSU/SDSU shall include “Sustainability” as a component of the scoring criteria and weigh each builder/developer’s commitment to implementing strategies above and beyond CBC Title 24, CalGreen and LEED Silver (Version 4.0) as at least 10% of the overall scoring.

• CSU/SDSU shall require that all electrical conduit for the project site be designed, sized and installed to enable the future electrification of the entire project.

• CSU/SDSU either (1) shall require that purple pipe be installed in all streets with landscaping and stubbed to all parks, recreation and open space areas to provide reclaimed water for irrigation purposes or (2) shall otherwise provide for future connections to the City of San Diego’s Pure Water Phase 2 program to reduce potable water usage.

• CSU/SDU shall utilize pre-consumer organic food composting for the proposed Stadium and University-constructed buildings, and shall encourage the incorporation of composting facilities in the residential units developed through public-private partnerships (the P3 process). CSU/SDSU also shall utilize post-consumer organic food composting for the proposed Stadium and University-constructed buildings when feasible (e.g., when the University’s solid waste provider operates a facility that is permitted to accept post-consumer compost).

It also is noted that, in 2014, the CSU Board of Trustees adopted its Sustainability Policy. To the extent applicable, project-related development will comply with the principles and goals set forth in the CSU Sustainability Policy.
2. **PROJECT EMISSIONS INVENTORY ANALYSIS**

This section evaluates changes to the project’s emission inventory resulting from the implementation of five PDF updates.

2.1 **Methodology**

Updates from the DEIR analysis of the project inventory include the following five updates:

1. No natural gas or wood-burning fireplaces in residential units (see Table 1);
2. Additional solar photovoltaic (PV) panel installation (see Table 2);
3. Electric heating, cooling, and ventilation systems (HVAC) and electric water heating systems (see Table 3);
4. Naturally ventilated parking structures (see Table 4); and
5. EV chargers will be built in accordance with the 2019 Title 24 Building Standards (see Table 5).

The following sections present the methodology used to quantify inventory changes resulting from these updates.

**Residential Hearths**

The DEIR incorporated a limited number of natural gas fireplaces and no wood-burning fireplaces within project residences. The DEIR provided that, of all residential units in the project, up to 5% of the units could include a natural gas fireplace. In the FEIR, this PDF was revised to include no natural gas or wood-burning fireplaces within project residences. The modeling parameters and inputs used to quantify the associated emissions reductions are based on CalEEMod® defaults.

**Solar Photovoltaic (PV) Panels**

The DEIR incorporated solar PV panels on the available roof space on the project’s campus/office, hotel, and residential development areas. This PDF was revised in the FEIR to include an additional 3,000 square feet of solar PV panels on the proposed project’s stadium land use. The modeling parameters and inputs used to quantify this PDF are described in Appendix 4.7-1 of the DEIR.³

**Electric HVAC and Water Heating Systems**

The DEIR incorporated heating and cooling using natural gas and electricity based on CalEEMod® defaults for electricity and natural gas consumption. An additional PDF was included in the FEIR requiring all HVAC systems and water heating systems to be electric. To quantify reductions resulting from this PDF, the required natural gas for space and water heating was calculated for the project. The equivalent amount of electricity that would be needed to achieve the same level of heating was evaluated and the associated GHG emissions from that electricity usage was calculated.

Naturally Ventilated Parking Structures

The DEIR’s calculations were based on a design parameter requiring mechanical ventilation for the project parking structures. A PDF to naturally ventilate the parking structures for the project was added in the FEIR, reducing the amount of electricity needed for parking structures. To quantify this reduction, the electricity needed for ventilation for the parking structures was reduced to zero. (Note, the remaining electricity intensities, for Non-Title 24 uses and lighting, were retained.)

Additional EV Chargers

The DEIR provided that 3% of total residential parking spaces and 6% of total non-residential parking spaces would be supplied with the appropriate infrastructure to allow for future installation of EV chargers. Of these spaces, 50% would be equipped with EV charging stations. This PDF was revised in the FEIR to increase the total percentage of residential parking spaces from 3% to 10% per the 2019 Title 24 Building Standards. The methodology used to quantify greenhouse gas reductions from this PDF can be found in Appendix 4.7-1 of the DEIR.

2.2 Criteria Air Pollutant Emissions, Greenhouse Gas Emissions, and Energy Inventories

This section describes the updates to the project emissions and energy inventories.

2.2.1 Area Emissions

Area source emissions included in the DEIR analysis result from landscaping-related fuel combustion sources (such as lawn mowers), consumer products, hearths, and architectural coatings. Changes to the criteria air pollutant and greenhouse gas emissions inventories due to updates to Residential Hearths PDF were calculated according the methodology discussed in Section 2.1. The resulting changes to the criteria air pollutant and greenhouse gas emissions inventories from the updated PDF are shown in Table 1. Additional calculation details are discussed in Appendix 4.2-1 and 4.7-1 of the DEIR.

2.2.2 Energy Use Emissions, Electricity Consumption, and Natural Gas Consumption

Criteria air pollutant emissions and GHGs are emitted from buildings as a result of activities that typically use electricity and natural gas as energy sources. Combustion of fossil fuels, such as natural gas, emits criteria air pollutants directly into the atmosphere. Combustion of any type of fuel emits CO₂ and other GHGs directly into the atmosphere; these emissions are considered direct emissions associated with a building. GHGs are also emitted during the generation of electricity from fossil fuels; these emissions are considered to be indirect emissions.

Updates to the Solar Photovoltaic Panels PDF provide further energy generation and reductions to GHG emissions, as shown in Table 2. The additional on-site renewable electricity generation will help to further offset the project’s electricity demand.

---

The Building Heating and Cooling PDF increases the consumption of electricity and reduces natural gas consumption. The changes to the consumption, and corresponding changes in criteria air pollutant and GHG emissions, are presented in Table 3.

Additionally, the design update to naturally ventilate the parking structures rather than mechanically ventilate the structures reduces the electricity consumption and corresponding greenhouse gas emissions for the project, as displayed in Table 4. The use of natural ventilation in place of mechanical ventilation is expected to result in a reduction to electricity use equivalent to 11,489,244 kWh of electricity per year.

### 2.2.3 Mobile Source Emissions and Gasoline Consumption

The emissions associated with on-road mobile sources are generated from residents, students, workers, customers, and delivery vehicles visiting the land use types in the project. The emissions associated with on-road mobile sources include running and starting exhaust emissions, evaporative emissions, brake and tire wear, and fugitive dust from paved and unpaved roads.

The methodology used for estimating emissions associated with mobile sources is described in the DEIR. Decreases in the GHG emissions from the additional installation of EV charging stations are shown in Table 5. This updated project design feature also results in a reduction to gasoline consumption and increase in electricity consumption.
3. PROJECT INVENTORIES IN CONTEXT

Table 6 reports the total GHG emissions resulting from construction and operation of the project. As shown, the project’s GHG emissions inventory is approximately 63,630 MT CO₂e per year. When compared to the GHG emissions inventory presented in the DEIR, the total GHG emissions resulting from the project are now 7.4% lower due to implementation of the updated project design features.

Table 7 presents the project’s criteria air pollutant emissions inventory with incorporation of the updated project design features contained in the FEIR. The commitment to zero natural gas fireplaces and all electric heating and cooling reduces the total daily emissions of each criteria air pollutant. The significance conclusions, which continue to be based on the SDAPCD Significance Thresholds, remain the same as those stated in the DEIR.

Table 8 provides the changes to the project’s consumption of electricity, natural gas, gasoline, and diesel. As compared to the project contributions presented in the DEIR, the project with updated PDFs contributes even less to the overall City of San Diego and California total consumption of natural gas, gasoline, and diesel. The increase in the electricity contribution represents the replacement of a higher-emitting energy source (natural gas, gasoline, and diesel), with electricity, a cleaner energy source. These updated contributions are presented in Table 9.

---

Notes:

3. Natural gas consumption for non-residential HVAC systems was estimated by scaling total non-residential natural gas use by a percentage of natural gas that is used for heating and cooling as calculated from the California CEUS data. Available at: http://capabilities.itron.com/CeusWeb/Chart.aspx. Accessed: November 2019.

5. Natural gas consumption for non-residential water heating systems was estimated by scaling total non-residential natural gas use by a percentage of natural gas that is used for water heating as calculated from the California CEUS data. Available at: http://capabilities.itron.com/CeusWeb/Chart.aspx. Accessed: November 2019.

6. Electricity that would be needed to achieve the same level of space heating as natural gas was estimated based on typical annual fuel utilization efficiencies (AFUE) of electric and natural gas furnaces. AFUE for electric furnace was obtained from https://www.energy.gov/energysaver/home-heating-systems/furnaces-and-boilers. Accessed: November 2019. AFUE for natural gas furnace was obtained from: https://www.energy.gov/eere/femp/energy-cost-calculator-electric-and-gas-water-heaters-0. Accessed: November 2019.

8. Consistent with the methodologies in Appendix 4.2-1 of the DEIR, CAP emissions associated with natural gas consumption were calculated using the default emission factors in CalEEMod⁸.

9. GHG emissions were calculated using the CO₂e intensity factor from Appendix B in Appendix 4.7-1 of the Draft EIR.

**Abbreviations:**

AFUE - annual fuel utilization efficiency  
BTU - British thermal unit  
CalEEMod⁸ - CALifornia Emissions Estimator MODel  
CAP - criteria air pollutant

Notes:

1 Data obtained from Table 6-1 in Appendix 4.7-1 of the DEIR. Available at: http://missionvalley.sdsu.edu/eir-appendices.html. Accessed: November 2019.

2 Data obtained from Table 1.

3 Data obtained from Table 2.

4 Data obtained from Table 3.

5 Data obtained from Table 4.

6 Data obtained from Table 5.

7 Emissions are presented as CO$_2$e, which include CO$_2$, CH$_4$, and N$_2$O emissions, weighted by their respective global warming potentials.

8 Emissions reductions associated with project design features are shown as negative values due to the decrease in emissions.

Abbreviations:

CalEEMod$^®$ - CALifornia Emissions Estimator MODeL  
N$_2$O - nitrous oxide  
CH$_4$ - methane  
PDF - project design feature  
CO$_2$ - carbon dioxide  
PV - photovoltaic  
CO$_2$e - carbon dioxide equivalents  
SDSU - San Diego State University  
DEIR - Draft Environmental Impact Report  
TDM - Transportation Demand Management  
EV - electric vehicle  
GHG - greenhouse gases  
yr - year

² Data obtained from Table 1.
³ Data obtained from Table 3.

Abbreviations:
CAP - criteria air pollutant
CO - carbon monoxide
DEIR - Draft Environmental Impact Report
lbs - pounds
NOₓ - nitrogen oxide compounds (NO + NO₂)
PDF - project design feature
PM₁₀ - particulate matter less than 10 microns in diameter
PM₂.₅ - particulate matter less than 2.5 microns in diameter
SDAPCD - San Diego Air Pollution Control District
SDSU - San Diego State University
SOₓ - sulfur oxide compounds
VOC - volatile organic compounds
